

V7 Chart Explanation Report

Full-sample cumulative return chart

v7_strategy_comparison_full.png

The x-axis is date and the y-axis is cumulative return. Each line represents one strategy. A higher line means a higher historical cumulative return, but higher return does not mean lower risk.

Limitation: the chart only describes historical results and does not predict the future.

Testing-period cumulative return chart

v7_strategy_comparison_test.png

This chart focuses on out-of-sample performance. It helps evaluate whether a strategy remains stable outside the training period.

Limitation: the chart only describes historical results and does not predict the future.

Drawdown comparison chart

v7_drawdown_comparison.png

Drawdown measures the decline from a previous high. Deeper drawdowns imply higher historical downside risk.

Limitation: the chart only describes historical results and does not predict the future.

Rolling risk chart

v7_rolling_risk.png

Rolling metrics help evaluate stability. Rising rolling volatility indicates higher market risk, while a positive rolling Sharpe Ratio suggests better risk-adjusted performance.

Limitation: the chart only describes historical results and does not predict the future.
